CONTENTS

INTRODUCTION

- Tables 1-12—1967 neutron monitor data (uncorrected)
- Tables 13-24—1967 hourly mean station-level barometric pressure in units of 0.1 millibar, measured from a zero level of 940 millibar.
- Tables 25-36—1967 neutron monitor data corrected to a standard pressure of 980 millibar using exponential correction and an attenuation length of 138 gm cm^{-2} .

I. INTRODUCTION

This publication contains the detailed results obtained from the continuous recording neutron monitor at the ANARE station, Wilkes, Antarctica (geographic co-ordinates 66° 15'S, 110° 31'E; geomagnetic co-ordinates 78°S, 79°E) during 1967.

The work is a joint project of the Antarctic Division of the Department of External Affairs and the Physics Department of the University of Tasmania, and is carried out under the general supervision of Dr A. G. Fenton of that University.

The monitor contains 12 counters arranged in 3 identical 4-counter sections, each with separate power supplies and electronic recording circuits. The unit follows closely the design recommended for observations during the I.G.Y. (Simpson 1956).

Hourly-scaled count totals are read manually from banks of electromechanical registers connected so that counting takes place on a different register during each hour of a two-day period. Daily check totals are available from separate registers. Short-term records are available from a multipen event recorder chart. The intensity figures tabulated are the sum of count totals from all sections, except where indicated to be estimated from the sum of count totals from one or two sections only. The reliability of the three sections is checked by examining the rates of their separate daily count totals.

The equipment is located on a flat-roofed laboratory 10 metres above sea-level.

Daily sums and means are given except where figures are not available for all hours of the day. In this case the mean is omitted, and the total number of hours for which data are available is shown in brackets.

Attention is drawn to changes in monitor efficiency. To reduce a standard level as at March 1962, multiply the recorded data by the appropriate factor as indicated at the bottom of the tables of pressure-corrected data.

The barograph was somewhat sensitive to changes in the ambient temperature and was corrected, using the accurate barometer readings taken every 3 hours. Hours for which the average wind speed exceeded 45 m.p.h., or when the pressure varied over more than 3.0 mb during an hour, are indicated.

* = Wind exceeded 45 mph. N.B. Normalising factor = 1.0035. Severe pressure gradient Hour 01 24 December.

COSMIC RAY RECORDS

Station Wilkes
 Year 1967
 Month November

Triplex Neutron Monitor
 Scale Factor 64
 Exponential correction, attenuation length 138 gm/cm²

TABULATED Hourly Count Totals
 Corrected to Standard
 Pressure 980 Millibar

RF = Recording failure.

* = Wind exceeded 45 mph, also exceeded 45 mph Hour 07 20 November.

† = Estimated from two sections.

Severe pressure gradient Hour 20 19 November, Hour 07-18 20 November.

RF = Recording failure.
‡ = Extrapolated from two sections.
* = Wind speed exceeded 45 mph.
N.B.—Normalizing factor = 1.0042.
Severe pressure gradient Hour 17 on 2 July, Hour 02 on 3 July, Hour 24 on 7 July, Hour 04 on 8 July, Hour 13 on 9 July, Hour 23 on 10 July, Hour 13 on 21 July.

COSMIC RAY RECORDS

Station Wilkes
Year 1967
Month June

Triplex Neutron Monitor
Scale Factor 64
Exponential correction, attenuation length 138 gm/cm²

TABULATED Hourly Count Totals
Corrected to Standard
Pressure 980 Millibar

N.B.—Normalizing factor = 1.0066.
Wind does not exceed 45 mph.

COSMIC RAY RECORDS

Station Wilkes
Year 1967
Month January

Triplex Neutron Monitor
Scale Factor 64
Exponential correction, attenuation length 138 gm/cm²

TABULATED Hourly Count Totals
Corrected to Standard
Pressure 980 Millibar
